

SPARC

Strategic Partnership for AI
and Rotterdam's Challenges

SPARC is a collaborative initiative between Delft University of Technology, Erasmus University, and the municipality of Rotterdam focusing on the integration of AI solutions within the municipality.

Designed as a dynamic operational framework, SPARC bridges the gap between innovation and public service, serving as relevant launchpad for data-driven projects within the municipality.

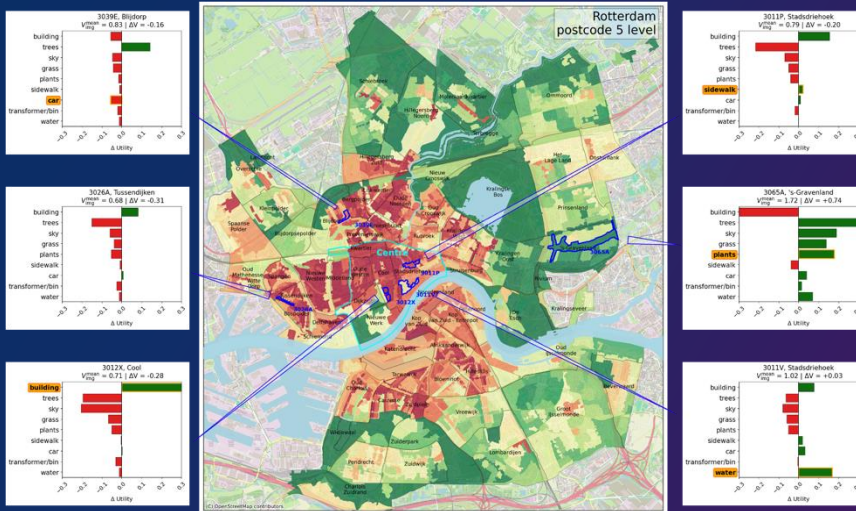

Our vision

Establish an **Urban AI Innovation Hub** at the Municipality of Rotterdam that provides a dedicated space for developing scientific, data-driven solutions. The focus is on connecting other municipalities, universities, industry partners, and other urban stakeholders to advance sustainable, safe, and inclusive cities, while fostering collaboration, knowledge exchange, and talent development.

Some projects...

Urban livability with computer vision

This project quantifies urban livability in Rotterdam by integrating Computer Vision to process visual preference surveys with Discrete Choice Models to statistically weigh and map citizen perceptions.

Visual characteristics on real state pringing

This study employs Computer Vision to extract urban features from imagery, leveraging them to predict residential property values and analyze how visual aesthetics explain price variables in Rotterdam's housing market.
